

Traceability for Ridder iQ

If your company deals with certified materials, the articles must always be traceable. Moreover, it should be clear which certificates and characteristics are associated with such a product and in which orders these materials have been processed. This prevents incorrect product deliveries and allows you to quickly identify production errors. But how do you organize that? Traceability makes it easy for you.

Traceability is intended for manufacturing companies that want to streamline their certification process as efficiently as possible. No more time-consuming searches for the origin of a product, but all information quickly accessible. With the help of this module, you can easily create batches for your raw materials and serial number registration for your purchased parts. The correct characteristics, batch numbers, serial numbers, and certificates can all be recorded in Ridder iQ. The raw materials you purchase receive a unique batch number with the correct batch numbers and characteristics linked to them. For purchased parts, you can record unique serial numbers with all the associated data.

You can also use both batch registration and serial number registration for products that

you create yourself, both at the manufacturing part and final product level. Traceability is specifically designed to make products traceable. If there are defects in the materials used after delivery of the order, it is immediately possible to determine which certified materials were used and with which characteristics. It also shows in which other (ongoing) orders similar materials have been used.

No chance of errors and a significant time and cost savings in terms of inventory assessment.

Dangerous situations

This traceability is essential if the materials used can cause dangerous situations. For example, if the article is processed into a suspension component for the aerospace industry, potentially leading to a recall. With this module, you have precisely insight into which end products are involved with which customers.

Traceability capabilities

Within Traceability, it is immediately clear in which projects, orders, or sub-orders a particular item is used (with corresponding batch numbers and certificates). Additionally, you can see directly which customers the products have been shipped to. Insight into which supplier provided the raw material is also available in one overview.

Expiration date and warranty

Do certain batches have an expiration date or warranty period? You easily link this information to the appropriate batches. Ridder iQ can always specify the materials from the batch based on the expiration date. Ridder iQ Traceability is an ideal addition for your company to optimize traceability and certification without investing in expensive external software systems.

Traceability for your company?

Would you like more information on how to apply this module within your organization? Our Account Manager will gladly schedule a meeting with you to demonstrate all the possibilities of the software.
